REPLACEMENT SCREENS

OPENING RATIOS

The following steps should be taken to determine the ratio of openings through strainer screens to the area of the inlet pipe size.

- 1. Determine the size of mesh or perforation required to give the desired particle retention
- 2. Multiply the total area of the screen by the percent of open area of the perforation or mesh material. The result is the open area of the screen
- 3. The open area of the screen divided by the area of the pipe will give the ratio of open area of the screen to the area of the pipe
- 4. To determine the ratio of open area to the pipe on mesh lined reinforcing screens, complete step two (2) to find the open area of the mesh. Multiply the open area of the mesh by the percent of open area of the reinforcing material. The result divided by the area of the pipe will be the ratio of open area of the screen to the area of the pipe.

STRAINER SCREEN DATA

Our strainer screens are made in a variety of perforations and mesh openings to best suit the application. Standard material is 304 stainless steel. Other screen materials are available upon request

When screens are constructed of very fine mesh wire cloth they are reinforced with a rigid outer shell of perforated sheet. Perforated sheets are made of sheet stainless steel, the thickness of which is not greater than half the size of the perforations.
